

# Star Schema - Financial Transactions

Grain: one row of Fact\_Transactions = one transaction from the account statement

\* Dim\_Geography hierarchy: the assignment states Country -> Region -> Sub-region. Country -> Sub-region -> Region was adopted instead because the data shows that each region contains several distinct sub-regions (e.g. Europe -> Northern/Southern/Eastern/Western Europe), whereas each sub-region belongs to exactly one region: the sub-region is therefore the intermediate level between country and region.
